

Answer Sheet No. $\qquad$

Sign. of Candidate $\qquad$

Sign. of Invigilator $\qquad$

## CHEMISTRY HSSC-I

SECTION - A (Marks 17)
Time allowed: $\mathbf{2 5}$ Minutes
Section - A is compulsory. All parts of this section are to be answered on this page and handed over to the Centre Superintendent. Deleting/overwriting is not allowed. Do not use lead pencil.

## Q. 1 Fill the relevant bubble for each part. Each part carries one mark.

1. Plasma is the mixture of:
A. Electrons and protons only.
B. Electrons and positive ions.
C. Electrons and beta two particles.
D. Neutrons and protons.

2. The electrode potential of metals are:

$$
\begin{array}{ll}
\mathrm{Mg}^{2+}+2 \mathrm{e}^{-} \longrightarrow \mathrm{Ag}^{+}+1 \mathrm{e}^{-} & \mathrm{Mg} \\
\mathrm{gg} \longrightarrow \mathrm{E}^{\circ}=-2.71 \mathrm{v} \\
\mathrm{E}^{\circ}=-0.8 \mathrm{v}
\end{array}
$$

Cell potential (emf) of the cell formed by these two will be:
A. $\quad+3.51 \mathrm{v}$
$\bigcirc$
B. $\quad-3.51 \mathrm{v}$
D. $\quad-1.91 \mathrm{v}$
3. At constant Pressure what will be the change in temperature when the volume of a gas will become twice of what it is at $0^{\circ} \mathrm{C}$ ?
$\begin{array}{ll}\text { A. } & 546^{\circ} \mathrm{C} \\ \text { C. } & 546 \mathrm{~K}\end{array}$
$\bigcirc$
B. $\quad 200^{\circ} \mathrm{C}$
D. $\quad 273 \mathrm{~K}$

4. Rate equation for a reaction $2 \mathrm{~A} \longrightarrow$ product is Rate $=\mathrm{K}[\mathrm{A}]^{2}$. Unit of specific rate constant for this reaction is:
A. $\quad \mathrm{mol}^{2} \mathrm{dm}^{-6} \mathrm{~S}^{-1}$
C. $\mathrm{moldm}^{-3}$B. $\quad \mathrm{mol}^{-1} \mathrm{dm}^{3} \mathrm{~S}^{-1}$ D. $\quad \mathrm{S}^{-1}$
$\bigcirc$
5. A substance which itself is not a catalyst but increases the activity of a catalyst is called:
A. Enzyme
$\bigcirc$
B. inhibitor Promoter
D. Poisoner

Page 1 of 2
6. Diamond is a bad conductor of electricity because:
A. It has a tight structure $\bigcirc$ B. It has a high density
It has no free electrons $\bigcirc \mathrm{D}$. It is transparent to light
7. Mixture containing $0.01 \mathrm{~mole} / 300 \mathrm{~cm}^{3}$ of $\mathrm{NH}_{4} \mathrm{Cl}$ and $0.1 \mathrm{~mole} / 400 \mathrm{~cm}^{3}$ of $\mathrm{NH}_{4} \mathrm{OH}$ having $\mathrm{pKb}=5$ has pH of:
A. $\quad 4.00$
$\bigcirc$
B. 4.12
C. $\quad 9.88$
D. $\quad 10.00$
8. 5 g of urea $(\mathrm{M} \cdot \mathrm{wt}=60)$ is dissolved in $250 \mathrm{~cm}^{3}$ of its solution. Concentration of solution will be:
A. $5 \% \mathrm{w} / \mathrm{w}$
$\bigcirc$
B. $5 \% \mathrm{v} / \mathrm{w}$
D. 0.34 m
$\bigcirc$
9. The gaseous element X exists in diatomic form. One volume of the element X combines with two volume of hydrogen to form two volume of gaseous hydride. What is the formula of hydride of X.?
A. $\mathrm{HX}_{2}$
$\bigcirc$
B. $\quad \mathrm{HX}_{3}$
$\bigcirc$
10. The number of bonds in one molecule of Nitrogen is:
A. one $\sigma$ and one $\pi$
$\bigcirc$
B. one $\sigma$ and two $\pi$
C. three $\sigma$ only
D. two $\sigma$ and one $\pi$

11. Splitting of spectral lines by placing the excited atom in electric field is called:
A. Zeeman effect
$\bigcirc$
B. Stark effect
C. Photoelectric effect
D. Compton effect

12. In the ground state of an atom, the electron is present:
A. in the valence shell nearest to the nucleus
B. in the second shell
D. farthest from the nucleus
13. Which one of the following exists in the solid state as a giant covalent lattice?
A. ice
C. silicon (IV) oxide

B. iodine
$\bigcirc$
14. pH of $1 \times 10^{-4} \mathrm{M}$ solution of Phosphoric acid is:

| A. $\quad 1.10$ |
| :--- | :--- |
| C. $\quad 3.52$ |

$\bigcirc$
B. 2.02
D. 4.13
$\bigcirc$
15. In which substance does nitrogen exhibit the highest oxidation state?
A. NO
$\bigcirc$
B. $\mathrm{N}_{2} \mathrm{O}$
D. $\mathrm{NaNO}_{2}$

16. The heat of neutralization of the given reaction is -57.3 kJ
$\mathrm{NaOH}+\mathrm{HCl} \longrightarrow \mathrm{NaCl}+\mathrm{H}_{2} \mathrm{O}$
What is the heat of neutralization of the following reaction?
$\begin{array}{lllll}\mathrm{Fe}(\mathrm{OH})_{2}+2 \mathrm{HCl} & \longrightarrow & \mathrm{FeCl}_{2}+2 \mathrm{H}_{2} \mathrm{O} & \\ \begin{array}{llll}\text { A. } & -57.3 \mathrm{~kJ} & \text { 〇. } & \text { B. } \\ \text { C. } & -228 \mathrm{~kJ} & \text { B. } & \text { D. } \\ \text { D. } & -28.6 \mathrm{~kJ}\end{array} & \end{array}$
17. Which of these samples of gas contains the same number of atoms as 1 g of hydrogen molecule? (At. Mass $\mathrm{C}=12, \mathrm{O}=16, \mathrm{H}=1, \quad \mathrm{Ne}=20$ )
A. $\quad 22 \mathrm{~g}$ of $\mathrm{CO}_{2}$
$\bigcirc$
B. 8 g of CH4
C. 20 g of Ne
D. 8 g of $\mathrm{O}_{3}$

# Federal Board HSSC-I Examination Chemistry Model Question Paper (Curriculum 2006) 

## MCQ'S KEY

| i B | ii A | iii C | iv B | v C | vi C | vii C | viii C | ix C | x B |

|  |  |  |  |  |  |  |  |  |  |

Q. No. 2(i): The bond angles of $\mathrm{H}_{2} \mathrm{O}$ and $\mathrm{NH}_{3}$ are not $109.5^{\circ}$ like that of $\mathrm{CH}_{4}$. Although O and N atoms are $\mathbf{S P}^{3}$ hybridized like C . Give reason.

Ans: Bond angle in $\mathrm{NH}_{3}$ is $107.5^{\circ}$. This is due to lone pair, bond pair repulsion is greater than bond pair, bond pair repulsion. So bond angle is reduced to $107.5^{\circ}$ although there is $\mathrm{sp}^{3}$ hybridization in N . Bond angle in $\mathrm{H}_{2} \mathrm{O}$ is $104.5^{\circ}$. This is due to lone pair, lone pair repulsion is greater than lone pair, bond pair repulsion. So bond angle is reduced to $104.5^{\circ}$ although there is $\mathrm{sp}^{3}$ hybridization in oxygen. CH4 has no lone pair. So bond angle is $109.5^{\circ}$ and C is sp 3 hybridized.
Q. No. 2(ii) As both $\mathrm{NF}_{3}$ and $\mathrm{BF}_{3}$ are tetra atomic molecules but have different shape and geometry. Explain according to VSEPR theory.

Ans: $\mathrm{NF}_{3}, \mathrm{~N} 1 \mathrm{~s}^{2}$, Valence Shell

2s $2 p x 2 p y 2 p z$
Total electron pair Lone pair Bond pair
4
1
3
Shape of NF3 is trigonal pyramidal with angle $107.5^{\circ}$. This is due to one lone pair and three bond pair while in $\mathrm{BF}_{3}$
${ }_{5} B 1 S^{2}, 2 s^{2}, 2 p^{1}$ Valence Shell
Ground state
$\square$

Excited state
$\square$

Total electron pair Lone pair Bond pair
3
0
3
Shape is trigonal due to three bond pair and no lone pair. Bond angle is $120^{\circ}$.
Q. No. 2 (iii) lonic Crystals are brittle in nature but metals are malleable in nature. Give reason of your answer.

Ans: It is because ionic solid consist of parallel layers in which cations and anions are present in alternate positions. Thus, when a stress is applied on crystal one layer of ions slides a little bit over the other layer. In this way like ions come in front of each other, which repel each other and thus a crystal is broken and show brittleness. When stress is applied on metal then layer slip over each other and their shape is changed. Hence they can be changed into sheets malleable or were ductile without breaking.
Q. No. 2(iv) Derive the units for general gas constant ' $R$ ' in general gas equation.

> a. When the pressure is in $\mathrm{Nm}^{-2}$ and volume in $\mathrm{m}^{3}$.
> b. When energy is expressed in ergs.

Ans: $P V=n R T$
$\frac{P V}{n T}=R$
$\mathrm{R}=\frac{1.01 \times 10^{5} \mathrm{~N} / \mathrm{m}^{2} \times 0.022414 \mathrm{~m}^{3}}{1 \mathrm{~mole} \times 273 \mathrm{~K}}$
$\mathrm{R}=8.314 \mathrm{Nm} \mathrm{mol}^{-1} \mathrm{k}^{-1}$
$\mathrm{R}=8.314 \mathrm{~J} \mathrm{~mole}^{-1} \mathrm{k}^{-1}$
$I J=10^{7} \operatorname{erg}$
$8.314 \mathrm{~J}=8.314 \times 10^{7} \mathrm{erg} \mathrm{mol}^{-1} \mathrm{k}^{-1}$
$R=8.314 \times 10^{7} \mathrm{erg} \mathrm{mol}^{-1} \mathrm{k}^{-1}$
Q. No. 2(v) Justify that the distance gaps between different orbits of an atom go on increasing from the lower to the higher orbits

Ans: For H
Z=1
If $n=1 \Rightarrow$ ell
$r_{1}=0.529 \mathrm{~A}^{\circ} \times \mathrm{n}^{2}$
$r_{1}=0.529 \mathrm{~A}^{\circ}$
If $n=2 \Longrightarrow$ shell

$r_{2}=0.529 A^{\circ}(2)^{2}=0.529 \times 4$
$r_{2}=2.116 \mathrm{~A}^{\circ}$
If $n=3 \Longrightarrow M$ shell
$r_{3}=0.529(3)^{2}$
$r_{3}=0.529 \times 9$
$r_{3}=4.761 \mathrm{~A}^{\circ}$
This shows that as n is increased gap between the orbits is also increased.
Q. No. 2(vi) Describe hybridization in acetylene $\left(\mathrm{C}_{2} \mathrm{H}_{2}\right)$ molecule. Also draw diagram of hybridized orbitals in this molecule.

Ans: $\mathrm{C}_{2} \mathrm{H}_{2}$
${ }_{6} \mathrm{C} \quad 1 s^{2}, 2 s^{2}, 2 p^{2}$
Ground State
4

Excited State

Sp hybridization

These are four hybrid orbital's. One $\delta$ bond is formed due to sp-sp end to end overlap. Two $\delta$ bonds are formed due to $\mathrm{sp}-1 \mathrm{~s}$ end to end overlap. One $\pi$ bond is formed due to $2 \mathrm{py}-2 \mathrm{py}$ lateral overlap. One $\pi$ bond is formed due to $2 p z-2 p z$ lateral overlap.
Q. No. 2(vii) Interpret why water and ethanol can mix easily in all proportions.

Ans: Water and ethanol are mixed in all proportion. This is due to the hydrogen bonding this between water and ethanol. Oxygen attains partial negative charge ( $-\delta$ ) and hydrogen attain partial positive charge $(+\delta)$. Hence H -bonding is formed in between ethanol and water. Secondly both exist in liquid state

Q. No. 2(viii) Justify that Bohr's equation for the wave number can explain the spectral lines of Lyman, Balmer and Paschen series.

Ans: From Bohr's wave number equation
$\bar{Y}=1.0967 \times 10^{7} \mathrm{~m}^{-1}\left[\frac{1}{n_{1}^{2}}-\frac{1}{n_{2}^{2}}\right]$
For Lyman's series $\mathrm{n}_{1}=1$
$\bar{\gamma}=1.0967 \times 10^{7} \mathrm{~m}^{-1}\left[\frac{1}{1^{2}}-\frac{1}{n_{2}^{2}}\right]$

Where $n_{2}=2,3,4 . \ldots$.
For Bulmer's series
$\bar{\nu}=1.0967 \times 10^{7} \mathrm{~m}^{-1}\left[\frac{1}{2^{2}}-\frac{1}{n_{2}^{2}}\right]$
Where $n_{2}=3,4,5 \ldots$.
For Paschalis Series
$\bar{\gamma}=1.0967 \times 10^{7} \mathrm{~m}^{-1}\left[\frac{1}{3^{2}}-\frac{1}{n_{2}^{2}}\right]$
Where $n_{2}=4,5,6 \ldots$.
Hence Bohr's equations justify the Lyman's, Bulmer's and Paschen's series.
Q. No. 2(ix) State Dalton's law. Also write its two applications.

Ans: Sum of the partial pressure of the non-reacting gases is equal to the total pressure of the gases
$P_{t}=P_{1}+P_{2}+P_{3}+\ldots \ldots$
Where $P_{1}, P_{2}$ and $P_{3}$ are the partial pressure of the gases and pt is the total pressure of the gases.

## Applications:

1. When gas is collected over vapors of water then

$$
\mathrm{P}_{\text {gas }}=\mathrm{P}_{\text {total }}-\mathrm{P}_{\mathrm{H} 2 \mathrm{O}}
$$

Where $\mathrm{P}_{\mathrm{H} 2 \mathrm{O}}$ is called aqueous tension. The respiration in living things depends upon the difference in partial pressure. Partial pressure of $\mathrm{O}_{2}$ outside is $159 \mathrm{~g} / \mathrm{cm}^{2}$ than in lungs, where the pressure is $116 \mathrm{~g} / \mathrm{cm}^{2}$ at higher altitudes becomes $150 \mathrm{~g} / \mathrm{cm}^{2}$ so pilot may have uncomfortable breathing.
Q. No. 2(x)The melting and boiling points of hydrazine $\left(\mathrm{N}_{2} \mathrm{H}_{4}\right)$ are much higher than those of ethane $\left(\mathrm{C}_{2} \mathrm{H}_{4}\right)$. Suggest reasons for these differences in terms of the intermolecular forces each compound possesses.

Ans: $\mathrm{N}_{2} \mathrm{H}_{4}$ has lone pair and H - bonding. So M.P and B.P of $\mathrm{N}_{2} \mathrm{H}_{4}$ is much greater while in ethane $\mathrm{C}_{2} \mathrm{H}_{6}$ there is weak London dispersion force. So B.P is very low. B.P of $\mathrm{C}_{2} \mathrm{H}_{6}$ is $-88.6^{\circ} \mathrm{C}$

## H-bonding

Q. No. 2(xi) Consider this graph and explain on the basis of Maxwell Boltzmann curve of kinetic energy why does rate of reaction increase with the increase in temperature.

Ans: Effective collisions bring about the reaction. For a collision to be effective molecules must posses the activation energy and must be properly oriented. At ordinary temperature very few molecules possess this energy of activation. All the molecules of a reactant do not possess the same energy at a particular temperature. Most of them possess average energy. A fraction of molecules has kinetic energy more than the average energy. The number of molecules having at least kinetic energy equal to Ea at temperature T in proportional to the shaded area under the Maxwell Boltzmann curve of kinetic energy. As the temp is increased the area of the shaded region increases and more molecules have kinetic energy greater than Ea. An increase in temp increase the number of reactant molecules that have enough energy for effective collision.
Q. No. 2(xii)An aqueous solution of ammonium Chloride is acidic and that of sodium acetate is basic in nature. Give reason with the help of equations.

On hydrolysis of NH 4 Cl , strong acid HCl is produced. Hence ammonium chloride aqueous solutions is acid $\mathrm{PH}<7$

On hydrolysis of $\mathrm{CH}_{3} \mathrm{COONa}$, strong base NaOH is produced. Hence sodium acetate aqueous solution is basic in nature $\mathrm{PH}>7$
Q. No. 2(xiii)Calculate molarity of aqueous solution of sulfuric acid from the following data.

| Molar mass | Molarity | Density in $\mathrm{g} / \mathrm{Cm}^{3}$ |
| :---: | :---: | :---: |
| 98 | 18 | 1.84 |

Ans: Molarity $=18 \mathrm{~mol} / \mathrm{dm}^{3}=18 \mathrm{~mol} / 1000 \mathrm{~cm}^{3}$
Density $=1.84 \mathrm{~cm}^{-3}$
$\mathrm{d}=\frac{m}{v}$
$m=d \times v$
$m=1.84 \times 1000$
$m=1840 \mathrm{~g} \mathrm{H}_{2} \mathrm{SO}_{4}$
Mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=$ Mole $\times$ Molar mass
Mass of $\mathrm{H}_{2} \mathrm{SO}_{4}=18 \times 98=176 \mathrm{~g} \mathrm{H}_{2} \mathrm{SO}_{4}$
Mass of water $=1840-1764=76 \mathrm{~g} \mathrm{H}_{2} \mathrm{O}$

$$
\begin{aligned}
& \text { Molarity }=\frac{\text { Mole } \times 1000}{\text { Mass of H2O }} \\
& \text { Molarity }=\frac{18 \times 1000}{76} \\
& \text { Molarity }=236.84 \mathrm{~m}
\end{aligned}
$$

Q. No. 2(xiv)Lattice energies of LiCl and KCl are $833 \mathrm{~kJ} / \mathrm{mol}$ and $690 \mathrm{~kJ} / \mathrm{mol}$, respectively. Discuss why is lattice energy of LiCl greater than KCl ?

Ans: Size of $\mathrm{Li}^{+}$is smaller than size of $\mathrm{K}^{+}$hence force of attraction between $\mathrm{Li}^{+}$and $\mathrm{Cl}^{-1}$ is much greater as compare to force of attraction between $\mathrm{K}^{+}$and $\mathrm{Cl}^{-1}$. These force lattice energy of LiCl is $\mathrm{Q} 33 \mathrm{~kJ} / \mathrm{mol}$ while that of KCl is $690 \mathrm{~kJ} / \mathrm{mol}$

$$
\mathrm{LiCl}(\mathrm{~s}) \longrightarrow \mathrm{Li}^{+}+\mathrm{Q}^{-}(\mathrm{g})
$$

$\mathrm{KCl}(\mathrm{s}) \longrightarrow \mathrm{K}^{+}+\mathrm{Q}^{-}(\mathrm{g})$
Size of $\mathrm{Li}^{+}<$size of $\mathrm{K}^{+}$
Q. No. $2(x v)$ Benzene $\left(C_{6} H_{6}\right)$ is an aromatic hydrocarbon which exists as a liquid at room temperature.

Using the following standard enthalpy changes:
Heat of formation of $\mathrm{CO}_{2}=-393 \mathrm{KJ} / \mathrm{mol}$
Heat of formation of $\mathrm{H}_{2} \mathrm{O}=-286 \mathrm{KJ} / \mathrm{mol}$
Heat of combustion of $\mathrm{C}_{6} \mathrm{H}_{6}=-3268 \mathrm{KJ} / \mathrm{mol}$
Calculate the enthalpy change of formation of $\mathrm{C}_{6} \mathrm{H}_{6}$.
Ans:
$\mathrm{C}_{6} \mathrm{H}_{6}+\frac{15}{2} \mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2}+3 \mathrm{H}_{2} \mathrm{O} \quad \Delta \mathrm{H} 1=-3268 \mathrm{~kJ} / \mathrm{mol}$
For formation reverse the equation
(i) $6 \mathrm{CO}_{2}+3 \mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{C}_{6} \mathrm{H}_{6}+\frac{15}{2} \mathrm{O}_{2} \quad \Delta \mathrm{H}_{1}=+3268 \mathrm{~kJ} / \mathrm{mol}$
(ii) $6 \mathrm{C}+6 \mathrm{O}_{2} \longrightarrow 6 \mathrm{CO}_{2} \longrightarrow \Delta \mathrm{H}_{2}=-393 \times 6$
(iii) $3 \mathrm{H}_{2}+\frac{3}{2} \mathrm{O}_{2} \longrightarrow 3 \mathrm{H}_{2} \mathrm{O} \Delta \mathrm{H}_{3}=-286 \times 3$

Adding above equation
$6 \mathrm{C}+3 \mathrm{H}_{2}-\mathrm{CH}_{6}$
From Hisses Law
$\Delta \mathrm{H}_{\mathrm{f}}=\Delta \mathrm{H}_{1}+\Delta \mathrm{H}_{2}+\Delta \mathrm{H}_{3}$
$\Delta \mathrm{H}_{\mathrm{f}}=+3258-2358-858$
$\Delta \mathrm{H}_{\mathrm{f}}=52 \mathrm{~kJ} / \mathrm{mol}$
Q. No. 2(xvi)Consider the Standard electrode potentials

$$
\mathrm{Ag}^{+} / \mathrm{Ag}=0.7994 \mathrm{~V}, \quad \mathrm{Fe}^{3+} / \mathrm{Fe}=0.771 \mathrm{~V}
$$

Write the half-cell reactions at each electrode. Also write overall reaction
Ans: $\quad \mathrm{E}_{\text {cell }}=\mathrm{E}_{\text {cahode }}-\mathrm{E}_{\text {anode }}$
$\mathrm{E}_{\text {cell }}=0.7994-0.771$

$$
\mathrm{E}_{\text {cell }}=+0.02 \mathrm{Q} 4
$$

## At cathode Reduction

$$
\left(\mathrm{Ag}^{+}+\nsupseteq \longrightarrow \mathrm{Ag}\right) \times 3
$$

## At Anode Oxidation

$3 \mathrm{Ag}^{+}+\mathrm{Fe} \longrightarrow 3 \mathrm{Ag}+\mathrm{Fe}^{+3}$
Overall reaction
Q. No. 2(xvii) Chemical kinetics is concerned with rates of chemical reactions and factors that affects the rates of chemical reactions. Consider the following steps of reactions:

| $\mathrm{FeCl}_{3}(\mathrm{aq})+2 \mathrm{KI}(\mathrm{aq}) \longrightarrow$ | $\mathrm{Fel}_{2}(\mathrm{aq})+2 \mathrm{KCl}(\mathrm{aq})+\mathrm{Cl}^{-}(\mathrm{aq})$ |
| :--- | :--- |
| $2 \mathrm{KI}(\mathrm{aq})+2 \mathrm{Cl}(\mathrm{aq}) \longrightarrow$ | (slow) |
| $2 \mathrm{KCl}(\mathrm{aq})+\mathrm{I}_{2}(\mathrm{~S})$ | (fast) |

a. Write the rate expression for the above reaction.
b.Give the order of reaction for the above reaction.

Ans:
a. Rate Law expression

$$
\text { Rate }=\mathrm{K}\left[\mathrm{FeCl}_{3}\right][\mathrm{KI}]^{2}
$$

b. Order of reaction $=1+2$

Order of reaction $=3^{\text {rd }}$ order reaction
Q. No. 2(xviii)What is reverse osmosis? Give its daily life applications.

Ans: If a solution in contact with pure solvent across a semi permeable membrane is subjected to an external pressure equal to osmotic pressure, it stops osmosis. If external pressure is greater than solutions osmotic pressure, it will force solvent to flow from solution to solvent. This process is called reverse osmosis.

## Daily life application of reverse osmosis:

Sea water is highly hypertonic to body fluids and this is not drinkable. By reverse osmosis it is subjected to desalination i.e remove large amounts dissolve salts from sea water. The sea water is pumped under high pressure 20 atm through the semi permeable membrane, which allow water molecules to pass and stop ions.
Q. No. 2(xix)How to calculate the molecular mass of the solute by using $\Delta P / P^{0}=X_{2}$ ?

Ans: From Roult's Law
$\frac{\Delta P}{P^{\circ}}=\mathrm{X}_{2} \longrightarrow \mathrm{Eq}(1)$
Since $X_{2}=\frac{n_{2}}{n_{1}+n_{2}}$
Where $\mathrm{n}_{2}$ is the mole of solute. Neglect the $\mathrm{n}_{2}$ from denominator for dilute solution.
$\mathrm{X}_{2}=\frac{n_{2}}{n_{1}}$
$\mathrm{n}_{1}=\frac{W_{1}}{M_{1}}$
$\mathrm{n}_{2}=\frac{W_{2}}{M_{2}}$
Put in above equation
$\mathrm{X}_{2}=\frac{w_{2}}{M_{2}} \times \frac{M_{1}}{W_{1}}$
Put in eq 1
$\frac{\Delta P}{P^{\circ}}=\frac{W_{2} \times M_{1}}{M_{2} \times W_{1}}$
$\mathrm{M}_{2}=\frac{P^{\circ}}{\Delta P} \times \frac{W_{2} M_{1}}{W_{1}}$
Q. No. 2(xx)How to calculate standard electrode potential? Explain briefly.

Ans: Standard hydrogen electrode is used to know the electrode potential. It is made up of platinum wire, which is sealed in glass tube. It is dipped in 1 MHCl solution. $\mathrm{H}_{2}$ gas is introduced from the top. Oxidation as well as reduction potential of hydrogen is zero. So voltmeter shows the electrode potential of the required element.

At anode $\mathrm{Zn} \longrightarrow \mathrm{Zn}^{+2}+2 \mathrm{e}^{-} \quad \mathrm{E}^{\circ}{ }_{\text {oxi }}=$ ?
At cathode $2 \mathrm{H}^{+}+2 \mathrm{e}^{-} \longrightarrow \mathrm{H}_{2} \quad \mathrm{E}^{\circ}$ Red $=0.00 \mathrm{~V}$
$\mathrm{Zn}+2 \mathrm{H}^{+} \longrightarrow \mathrm{Zn}^{+2}+\mathrm{H}_{2}$
$\mathrm{E}^{\circ}{ }_{\text {cell }}=0.76 \mathrm{~V}$
$\mathrm{E}^{\circ}{ }_{\text {cell }}=\mathrm{E}^{\circ}{ }_{\mathrm{oxi}}+\mathrm{E}^{\circ}{ }_{\text {Red }}$
from voltmeter
$0.76 \mathrm{~V}=\mathrm{E}^{\circ}{ }_{\text {oxi }}+0.00$
$\mathrm{E}^{\circ}{ }_{\mathrm{oxi}}=0.76 \mathrm{~V}$
Q. No. 3 (a)Derive the equation for the radius of nth orbit of hydrogen atom using Bohr's model.

Ans: Electrons revolve around the nucleus in circular path. So centrifugal force is given by $\mathrm{F}=\frac{m v^{2}}{r}$

Coulomb's force of attraction between electron and proton in given by $\mathrm{F}=\frac{K q_{1} q_{2}}{r^{2}}$

Where $r_{1}=z e \quad$ and $q_{2}=e^{-} \quad K=\frac{1}{4 \pi \epsilon_{0}}$
$€_{\circ}$ is the primitivity constant of the vacuum
$€=8.85 \times 14^{-12} \mathrm{C}^{2} \mathrm{~N}^{-1} \mathrm{~m}^{-2}$
Put in above eq
$\mathrm{F}=\frac{Z e e}{4 \pi \epsilon_{\circ} r^{2}}$
$\mathrm{F}=\frac{Z e^{2}}{4 \pi €_{\circ} r^{2}} \longrightarrow \mathrm{Eq}(2)$
Where $Z$ is the atomic number
These two forces are equal. So by comparing Eq(1) and Eq(2)
$\frac{m v^{2}}{r}=\frac{Z e^{2}}{4 \pi \epsilon_{\circ} r^{2}}$
$\mathrm{V}^{2}=\frac{Z e^{2}}{4 \pi \epsilon_{\circ} r m}$
From Bohr's postulate angular momentum is given by
$m v r=\frac{n h}{2 \pi}$
Where n is the principal quantum number

$$
n=1,2,3 \ldots . . . .
$$

Shell K L M
$\mathrm{h}=$ plank's constant
$h=6.625 \times 10^{-34}$
$m$ is the mass of electron
$v$ is the velocity of electron
$r$ is the radius
$\mathrm{V}=\frac{n h}{2 \pi m r}$
Squaring both sides
$\mathrm{v}^{2}=\frac{n^{2} h^{2}}{4 \pi^{2} m^{2} r^{2}}$

$$
\longrightarrow \mathrm{Eq}(4)
$$

By comparing $\mathrm{Eq}(3)$ and $\mathrm{Eq}(4)$
$\frac{Z e^{2}}{4 \pi €_{\circ} r m}=\frac{n^{2} h^{2}}{4 \pi^{2} m^{2} r^{2}}$
$\frac{Z e^{2}}{€_{\circ}}=\frac{n^{2} h^{2}}{\pi m r}$
$r=\frac{n^{2} h^{2} €_{\circ}}{\pi m Z e^{2}}$
$r=\frac{h^{2} €_{\circ}}{\pi m Z e^{2}} \times \frac{n^{2}}{Z}$
$\longrightarrow E q(5)$
Let $\mathrm{a}^{\circ}=\frac{h^{2} €_{\circ}}{\pi m e^{2}}$
$a^{\circ}=\frac{\left(6.625 \times 10^{-34}\right)^{2}\left(8.85 \times 10^{-12}\right)}{3.14 \times 9.1 \times 10^{-31} \times\left(1.6 \times 10^{-19}\right)^{2}}$
$a \circ=0.529 \times 10^{-10}$
$\mathrm{a} \circ=0.529 \mathrm{~A}^{\circ}$

Put in Eq(5)
$r=a^{\circ} \times \frac{n^{2}}{z}$
$r=0.529 \mathrm{~A}^{\circ} \times \frac{n^{2}}{z}$
For hydrogen $z=1$
$r=0.529 \mathrm{~A}^{\circ} \times n^{2}$
(b)Ammonia Solvay process is used to manufacture sodium carbonate. During this process ammonia is recovered by the following reaction.

When 100 g of ammonium chloride and 150 g calcium hydroxide are used then
(At. Mass $\quad \mathrm{N}=14 \quad \mathrm{H}=1 \quad \mathrm{Cl}=35.5 \quad \mathrm{Ca}=40$ )
i. Calculate the mass in kg of ammonia produce during chemical reaction.
ii. Calculate the excess mass in gram of one of the reactant left unreacted.

Ans:

Mass of $\mathrm{NH}_{4} \mathrm{Cl}=100 \mathrm{~g}$
Molar mass of $\mathrm{NH}_{4} \mathrm{Cl}=14+1 \times 4+35.5$
Molar mass of $\mathrm{NH}_{4} \mathrm{Cl}=53.5 \mathrm{~g} / \mathrm{mol}$
Molar of $\mathrm{NH}_{4} \mathrm{Cl}=\frac{\text { Mass in gram }}{\text { Molar mass }}$
Molar of $\mathrm{NH}_{4} \mathrm{Cl}=\frac{100}{53.5}$
Molar of $\mathrm{NH}_{4} \mathrm{Cl}=1.87$ mole of $\mathrm{NH}_{4} \mathrm{Cl}$
From equation
2 moles of $\mathrm{NH}_{4} \mathrm{Cl}=2$ moles of $\mathrm{NH}_{3}$
1.87 moles of $\mathrm{NH}_{4} \mathrm{Cl}=x$

$$
\begin{aligned}
& =\frac{2}{2} \times 1.87 \\
& =1.87 \text { moles of } \mathrm{NH}_{3}
\end{aligned}
$$

Mass of $\mathrm{Ca}(\mathrm{OH})_{2}=150 \mathrm{~g}$
Molar mass of $\mathrm{Ca}(\mathrm{OH})_{2}=40+16 \times 2+1 \times 2$
Molar mass of $\mathrm{Ca}(\mathrm{OH})_{2}=74 \mathrm{~g} / \mathrm{mol}$
Molar of $\mathrm{Ca}(\mathrm{OH})_{2}=\frac{\text { Mass in gram }}{\text { Molar mass }}$
Molar of $\mathrm{Ca}(\mathrm{OH})_{2}=\frac{150}{74}$
Molar of $\mathrm{Ca}(\mathrm{OH})_{2}=2.03$ moles of $\mathrm{Ca}(\mathrm{OH})_{2}$
From equation
1 mole of $\mathrm{Ca}(\mathrm{OH})_{2}=2$ moles of $\mathrm{NH}_{3}$
2.03 moles of $\mathrm{Ca}(\mathrm{OH})_{2}=x$
$x=2 \times 203$
$x=4.06$ moles of $\mathrm{NH}_{3}$

Since $\mathrm{NH}_{4} \mathrm{Cl}$ produces the least amount of $\mathrm{NH}_{3}$. So $\mathrm{NH}_{4} \mathrm{Cl}$ is the limiting reactant.
Mass of $\mathrm{NH}_{3}=$ mole $\times$ molar mass of $\mathrm{NH}_{3}$
Mass of $\mathrm{NH}_{3}=1.87 \times 17$
Mass of $\mathrm{NH}_{3}=31.97 \mathrm{~g} \mathrm{NH}_{3}$
Mass of $\mathrm{NH}_{3}=\frac{31.97}{1000}$
Mass of $\mathrm{NH}_{3}=0.03197 \mathrm{Kg}$ of $\mathrm{NH}_{3}$
(ii) From equation

2 moles of $\mathrm{NH}_{4} \mathrm{Cl}=1$ mole of $\mathrm{Ca}(\mathrm{OH})_{2}$
1.87 moles of $\mathrm{NH}_{4} \mathrm{Cl}=x$
$\mathrm{x}=\frac{1.87 \times 1}{2}$
$x=0.935$ moles of $\mathrm{Ca}(\mathrm{OH})_{2}$ used
$\mathrm{Ca}(\mathrm{OH})_{2}$ left $=2.03-0.935$
$\mathrm{Ca}(\mathrm{OH})_{2}=1.095$ moles of $\mathrm{Ca}(\mathrm{OH})_{2}$ left
Mass of $\mathrm{Ca}(\mathrm{OH})_{2}$ left $=$ mole $\times$ molar mass
Mass of $\mathrm{Ca}(\mathrm{OH})_{2}$ left $=1.095 \times 74$
Mass of $\mathrm{Ca}(\mathrm{OH})_{2}$ left $=\mathrm{Q} 1.03 \mathrm{~g} \mathrm{Ca}(\mathrm{OH})_{2}$ left
Q. No. 4Consider the following reaction:

$$
\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons 2 \mathrm{NH}_{3}
$$

(a) Derive expression of Kc for the above reaction and calculate equilibrium concentration of $\mathrm{N}_{2}$. The equilibrium concentration of $\mathrm{H}_{2}$ and $\mathrm{NH}_{3}$ are $1.0 \mathrm{moldm}^{3}$ and $0.5 \mathrm{moldm}^{-3}$ respectively. Kc of above reaction at $25^{\circ} \mathrm{C}$ is $1.85 \times 10^{3}$.
Ans:
$\mathrm{N}_{2}+3 \mathrm{H}_{2} \rightleftharpoons \mathrm{NH}_{3}$
At $t=0$
$\mathrm{a} / \mathrm{vmol} / \mathrm{dm}^{3} \mathrm{~b} / \mathrm{vmol} / \mathrm{dm}^{3}$

$$
\frac{a-x}{v} \frac{b-3 x}{v} \frac{2 x}{v}
$$

$\mathrm{K}_{\mathrm{c}}$ is written as
$\mathrm{K}_{\mathrm{c}}=\frac{\left[\mathrm{NH}_{3}\right]^{2}}{\left[\mathrm{~N}_{2}\right]\left[\mathrm{H}_{2}\right]^{3}}$
By putting respective values.
$\mathrm{K}_{\mathrm{c}}=\frac{\left[\frac{2 x}{v}\right]^{2}}{\left[\frac{a-x}{v}\right]\left[\frac{b-x}{v}\right]^{3}}$
$\mathrm{K}_{\mathrm{c}}=\frac{4 x^{2}}{(a-x) \frac{(b-3 x)^{3}}{v^{4}}}$
$\mathrm{K}_{\mathrm{c}}=\frac{4 x^{2} v^{2}}{(a-x)(b-3 x)^{3}}$
$K_{c}=1.85 \times 10^{3} \quad V=1 \mathrm{dm}^{3}$
Equilibrium concentration
$\left[\mathrm{H}_{2}\right]=1.0 \mathrm{~mole} / \mathrm{dm}^{3}$
$\left[\mathrm{NH}_{3}\right]=0.5 \mathrm{~mole} / \mathrm{dm}^{3}$
$\left[\mathrm{NH}_{3}\right]=2 \mathrm{x}=0.5$
$x=\frac{0.5}{2}$
$\mathrm{x}=0.25 \mathrm{~mole} / \mathrm{dm}^{3}$
$\left[\mathrm{N}_{2}\right]=\mathrm{a}-\mathrm{x}$
$\mathrm{K}_{\mathrm{c}}=\frac{4 x^{2} v^{2}}{(a-x)(b-3 x)^{3}}$
$1.85 \times 10^{3}=\frac{4(0.25)^{2} \times 1}{(a-x) \times(1)^{3}}$
$(a-x)=\left[\mathrm{N}_{2}\right]=\frac{4(0.25)^{2}}{1.85 \times 10^{3}}$
$\left[\mathrm{N}_{2}\right]=1.35 \times 10^{-4} \mathrm{~mole} / \mathrm{dm}^{3}$
Equilibrium concentration of $\mathrm{N}_{2}$
Q. No. 4 (b)Balance the following chemical equation in an acidic medium

$$
\mathrm{Cr}^{3+}+\mathrm{BiO}_{3}{ }^{1-} \longrightarrow \mathrm{Cr}_{2} \mathrm{O}^{2-}+\mathrm{Bi}^{3+}
$$

Ans:
$\mathrm{Cr}^{+3}+\mathrm{BiO}_{3}^{-1} \xrightarrow{\mathrm{Cr}_{2} \mathrm{O}_{7}^{2}}+\mathrm{BC}^{3+}$
Step 1 write Oxidation number
$\mathrm{Cr}^{+3}+\left[\mathrm{Bi}^{+5} \mathrm{O}_{3}^{-2 \times 3}\right]^{-1} \longrightarrow\left[\mathrm{Cr}_{2}^{+6 \times 2} \mathrm{O}_{7}^{-2 \times 7}\right]^{2-}+\mathrm{BiC}^{3+}$
Steps 2 write half oxidation reaction. Balance $\mathrm{e}^{-}$
$2 \mathrm{Cr}^{+3} \longrightarrow\left[\mathrm{Cr}_{2}^{+6 \times 2} \mathrm{O}_{7}^{-2 \times 7}\right]^{2-}+6 \mathrm{e}^{-}$
Step 3 Balance oxygen by adding $7 \mathrm{H}_{2} \mathrm{O}$ on LHS
$2 \mathrm{Cr}^{+3}+7 \mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{r}_{2} \mathrm{O}_{7}^{2-}+6 e^{-}+14 \mathrm{H}^{+} \mathrm{Eq}(1) \longrightarrow$
Steps 4 write half reduction reaction. Balance the $\mathrm{e}^{-}$
$\left[\mathrm{Bi}^{+5} \mathrm{O}_{3}^{-2 \times 3}\right]^{-1}+2 \mathrm{e}^{-} \mathrm{Bi}^{3+} \longrightarrow$
Step 5Balance oxygen by adding $3 \mathrm{H}_{2} \mathrm{O}$ on RHS
$\mathrm{BiO}_{3}^{-1}+3 \mathrm{e}^{-}+6 \mathrm{H}^{+} \longrightarrow \mathrm{Bi}^{3+}+3 \mathrm{H}_{2} \mathrm{OEq}$ $\qquad$
Step 6 Balance the electrons by Xing Eq(2) by ' 2 ' and then add in Eq (1)
$2 \mathrm{Cr}^{+3}+7 \mathrm{H}_{2} \mathrm{O} \longrightarrow \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+6 \mathrm{e}^{-}+14 \mathrm{H}^{+}$
$2 \mathrm{BiO}_{3}^{-1}+6 \mathrm{e}^{-}+12 \mathrm{H}^{+} \longrightarrow 2 \mathrm{Bi}^{3+}+6 \mathrm{H}_{2} \mathrm{O}$
$2 \mathrm{Cr}^{+3}+7 \mathrm{H}_{2} \mathrm{O}+2 \mathrm{BiO}_{3}^{-1} \longrightarrow \mathrm{Cr}_{2} \mathrm{O}_{7}^{2-}+14 \mathrm{H}^{+}+2 \mathrm{Bi}^{3+}$
Balanced equation.
Q. No. 5 (a)Phosgene ( $\mathrm{COCl}_{2}$ ) is a toxic gas. This gas is prepared by the reaction of carbon monoxide with chlorine.

$$
\mathrm{CO}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g}) \longrightarrow \mathrm{COCl}_{2}(\mathrm{~g})
$$

The following data were obtained for kinetic study of this reaction.

| Experiment | Initial [CO] | Initial $\left[\mathrm{Cl}_{2}\right]$ | Initial rate $\left(\mathrm{moles} \mathrm{dm}^{-3} \mathrm{~s}^{-1}\right)$ |
| :---: | :---: | :---: | :---: |
| 1 | 1.000 | 0.100 | $1.29 \times 10^{-29}$ |
| 2 | 0.100 | 0.100 | $1.30 \times 10^{-30}$ |
| 3 | 0.100 | 1.000 | $1.30 \times 10^{-30}$ |

Use the data in the table to deduce the order of the reaction with respect to CO and $\mathrm{Cl}_{2}$. Hence write a rate law/equation for this reaction.

Ans:

| Exp | Initial conc <br> $[\mathrm{CO}]$ | Initial con <br> $\left[\mathrm{Cl}_{2}\right]$ | Initial rate |
| :---: | :--- | :--- | :--- |
| 1 | 1.0 | 0.1 | $1.29 \times 10^{-29}$ |
| 2 | 0.1 | 0.1 | $1.30 \times 10^{-30}$ |
| 3 | 0.1 | 1.0 | $1.31 \times 10^{-30}$ |

In experiment 1 and conc of $\mathrm{Cl}_{2}$ is constant and conc of CO vary. Ratio of conc is
Exp. 1 : Exp. 2

| 1.0 | 0.1 |
| :--- | :--- |
| 0.1 | 0.1 |

$10: 1$
Ratio of rate of reaction is $\exp 1$ and 2
Exp. $1 \quad: \quad$ Exp. 2

| $1.29 \times 10^{-29}$ | $1.30 \times 10^{-30}$ |
| :--- | :--- |
| $1.30 \times 10^{-30}$ | $1.30 \times 10^{-30}$ |

$10: 1$
Hence it is $1^{\text {st }}$ order W.r.t [CO]
Rate $=\mathrm{K}[\mathrm{CO}]^{1}$
$1^{\text {st }}$ order W.r.t CO

Conc of CO in experiment 2 and 3 is constant but conc of $\mathrm{Cl}_{2}$ vary. Conc ratio is
Exp. 2 : Exp. 3

| 0.1 | 1.0 |
| :--- | :--- |
| 0.1 | 0.1 |

$1: 10$
Rate ratio of Exp 2 and 3
Exp. 2 : Exp. 3

| $1.3 \times 10^{-30}$ | $1.3 \times 10^{-30}$ |
| :--- | :--- |
| $1.3 \times 10^{-30}$ | $1.3 \times 10^{30}$ |
| $1: 1$ |  |

As the conc is increased to 10 times but rate is constant. So $\mathrm{Cl}_{2}$ is zero order W.r.t $\mathrm{Cl}_{2}$

Rate $=\mathrm{K}\left[C l_{2}\right]^{0}$
Zero order of reaction W.r.t $\mathrm{Cl}_{2}$
Overall rate Law
Rate $=\mathrm{K}[\mathrm{CO}]^{1}\left[\mathrm{Cl}_{2}\right]^{0}$
Overall order of reaction $=1+0$
Overall order of reaction $=1^{\text {st }}$ order
(B)Show the diamagnetic/paramagnetic nature of $\mathrm{O}_{2}, \mathrm{O}_{2}{ }^{2+}$ and $\mathrm{O}_{2}{ }^{2-}$ with the help of molecular orbital theory.

Ans:
$\mathrm{O}_{2}$
${ }_{8} 0 \quad 1 s^{2}, 2 s^{2}, 2 p^{4} \quad$ Valence Shell

| $4 \downarrow$ | 4 | 4 |
| :---: | :---: | :---: |

2s 2px 2py 2pz

## Paramagnetic behaviour:

There are two compare electron in antibonding. So oxygen shows paramagnetic behaviour i.e attract towards magnet.

$$
O_{2}^{-2}
$$

$O^{-} \quad 1 s^{2}, 2 s^{2}, 2 p^{5}$

2s 2px 2py 2pz

$$
O_{2}^{+2}
$$

$O^{+} \quad 1 s^{2}, 2 s^{2}, 2 p^{5}$

2s 2px 2py 2pz
